**Physics 221 - Fall 2019**  
**★ Homework ★**  
**Chapter 4 & 5 - A**

1) Which of the following are approximately inertial reference frames (lets say have accelerations  $< 1\%$  g)?

- a) the classroom
- b) a turbulence-free airplane that is traveling at constant speed and direction
- c) a turbulence-free airplane that is traveling at constant speed but turning upward
- d) a rapidly spinning park merry-go-round
- e) a satellite orbiting the Sun at Mars' radius

2) Space-time conversions: What is:

- a) one foot in nano-seconds?
- b) one second in meters?
- c) one year in meters

3) 4.7

4) 5.8

5) 5.10

6) You are standing still in a reference frame,  $S$ . An object has stationary coordinates,  $(x', y', z')$  = (25, 20, 0) meters, as measured in a frame,  $S'$ , moving at  $u = 0.6c$ , with respect to (your)  $S$  frame. Assume the coordinate systems align and have the same origin at  $t = t' = 0$  and that  $u$  is in the  $x$ -direction.

a) Use the Lorentz transformations:

$$\begin{aligned}x' &= \gamma(x - ut) \\y' &= y \\z' &= z \\t' &= \gamma\left(t - \frac{ux}{c^2}\right)\end{aligned}$$

to calculate the coordinates of the object measured in (your)  $S$  frame at time  $t' = 1.0 \times 10^{-5}$  s (measured in the  $S'$  frame).

b) What is the  $S'$  coordinates of the object at the same  $t'$  as in a)?
