# Good time to review HW #1/#2

# Carnegie Curve linking lightning activity to fair-weather field

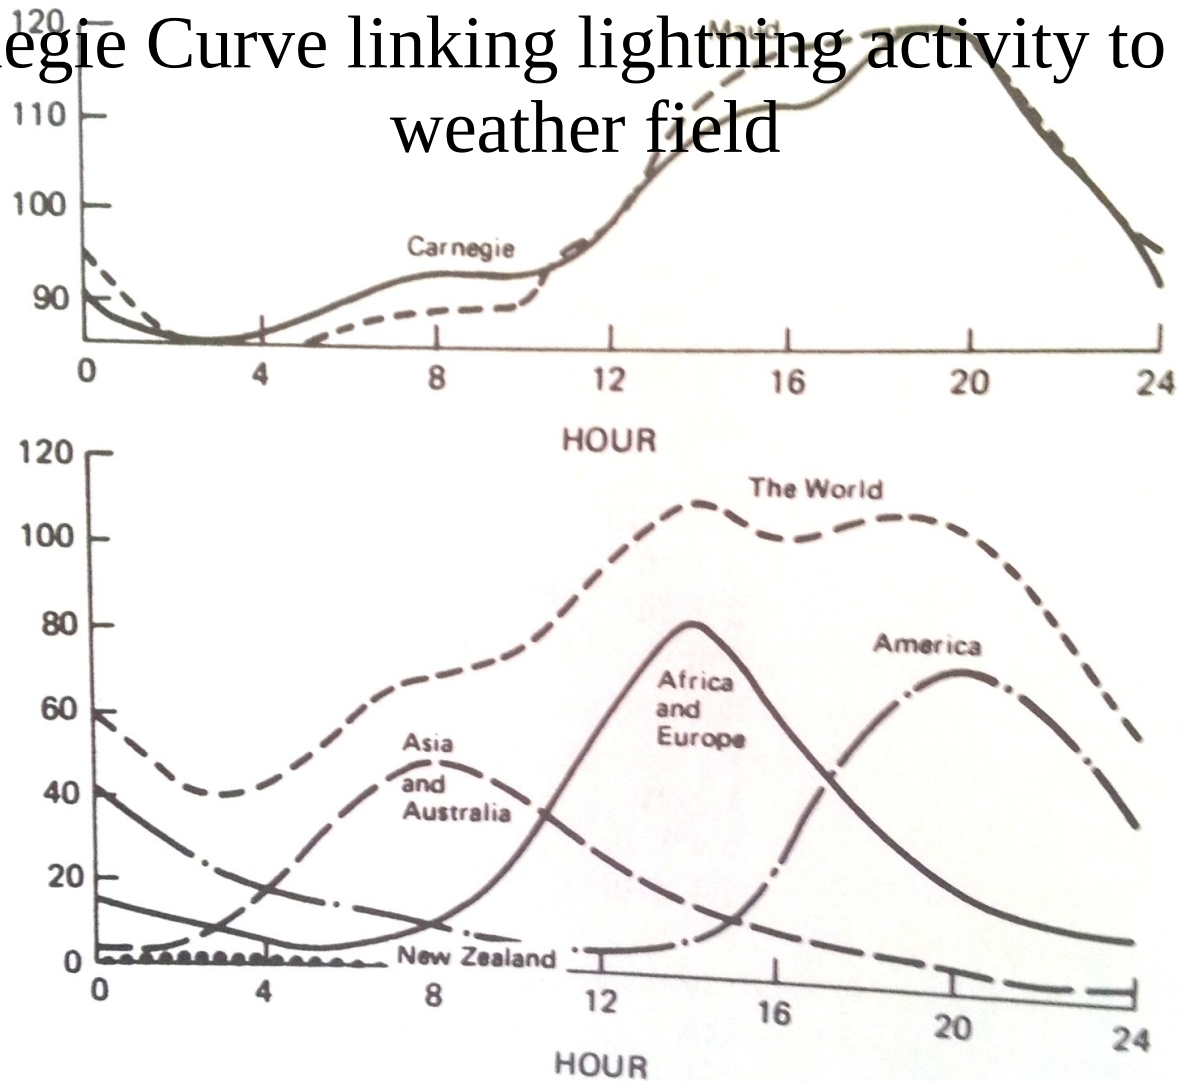

FIGURE 15.3 (a) Annual curve of the diurnal variation of the atmospheric electric field on the oceans (volts per meter) as measured by the Carnegie and Maud expeditions (Parkinson and Torrenson, 1931) and (b) annual curve of the diurnal variations of global thunderstorm activity according to Whipple and Scrase (1936).

$$\vec{J}_M = \vec{J}_E + \vec{J}_C + \vec{J}_L + \vec{J}_P + \frac{\partial \vec{D}}{\partial t} \quad \text{Below T.S.}$$

$$\vec{J}_M = \vec{J}_E + \frac{\partial \vec{D}}{\partial t} \quad \text{Above T.S.}$$

FIGURE 15.2 Schematic illustrating the various currents that flow within and in the vicinity of thunderstorms:  $\mathbf{J}_E$  is the conduction current,  $\mathbf{J}_c$  is a convection current,  $\mathbf{J}_L$  is the lightning current,  $\mathbf{J}_p$  is the precipitation current,  $\partial D/\partial t$  is the displacement current, and  $\mathbf{J}_M$  is the total Maxwell current.

# Exponential increase in conductivity

# Explain anisotropic conductivity

Explain the “nose” in the conductivity contours in next slide

# Anisotropic conductivity (lower at equator in z-direction)
