Electrical Potential Energy and Work. ²

$W = \text{Force} \times \text{distance}$ if the force is constant.

So inside a capacitor, where the electric field is constant, what is the Work on a charge Q ?

Electrical Potential Energy and Work. ³

$W = \text{Force} \times \text{distance}$ if the force is constant.

So inside a capacitor, where the electric field is constant, what is the Work on a charge Q ?

$$W = -QEd$$

$$U = -W = QEd$$

Electrical Potential Energy and Work. ⁴

What if you take a zigzag path through the capacitor?

Work **STILL** = QEd

(Try going on an Equipotential ...
no Work done there)

Electric Potential Energy

Gravitational

$$\text{Total Energy} = m g h_i + \frac{1}{2} m v_i^2 = m g h_f + \frac{1}{2} m v_f^2$$

Electric

$$\text{Total Energy} = q E h_i + \frac{1}{2} m v_i^2 = q E h_f + \frac{1}{2} m v_f^2$$

Homework ... Lecture 9, Problem 1

An 0.1 Coulomb sphere is at rest in 1000 N/C electric field. If it moves 3 meters through the field and its mass is 2 kg, what is its final speed?

Electric Potential Energy

Electric

$$\text{Total Energy} = q E h_i + \frac{1}{2} m v_i^2 = q E h_f + \frac{1}{2} m v_f^2$$

Formula only works if E is constant, but we can call Eh the Voltage (or potential). Then the formula becomes

$$\text{Total Energy} = q \phi_i + \frac{1}{2} m v_i^2 = q \phi_f + \frac{1}{2} m v_f^2$$

Electric Potential

$$\phi = \frac{U}{q}$$

(Potential is potential energy per unit charge)

So if you put 1 Coulomb through 10 Volts, it acquires 10 J.

In general $\text{Total Energy} = U_i + K_i = U_f + K_f$

Problems

You allow a 2 mCoulomb charged sphere with a mass of 1 kg to pass through 1000 Volts.

What will be its speed afterward?

(Homework 9-2)

What is the kinetic energy of the 1 kg sphere before and after going through 1000 Volts?

(Homework 9-3)

You allow a 2 mCoulomb charged sphere with a mass of 1 kg to pass through 1000 Volts.

What will be its speed afterward?

(Homework 9-2)

What is the kinetic energy of the 1 kg sphere before and after going through 1000 Volts?

(Homework 9-3)

Problems

What are the potential and kinetic energies of the proton after going through 1000 Volts?

(Homework 9-4)

A proton falls through 1000 Volts.
What is its speed?

(Homework 9-5)

What are the potential and kinetic energies of the proton after going through 1000 Volts?
(*Homework 9-4*)

A proton falls through 1000 Volts.
What is its speed?
(*Homework 9-5*)

Hewitt Problem 11-5 *(Homework 9-6)*

An electric field does 12 J of work on a charge of 0.0001 C as it moves from point A to point B. What is the voltage change between point A and point B?

How much work does this same field do on a charge of 0.0002 Coulombs?

Hewitt Problem 11-5 (*Homework 9-6*)

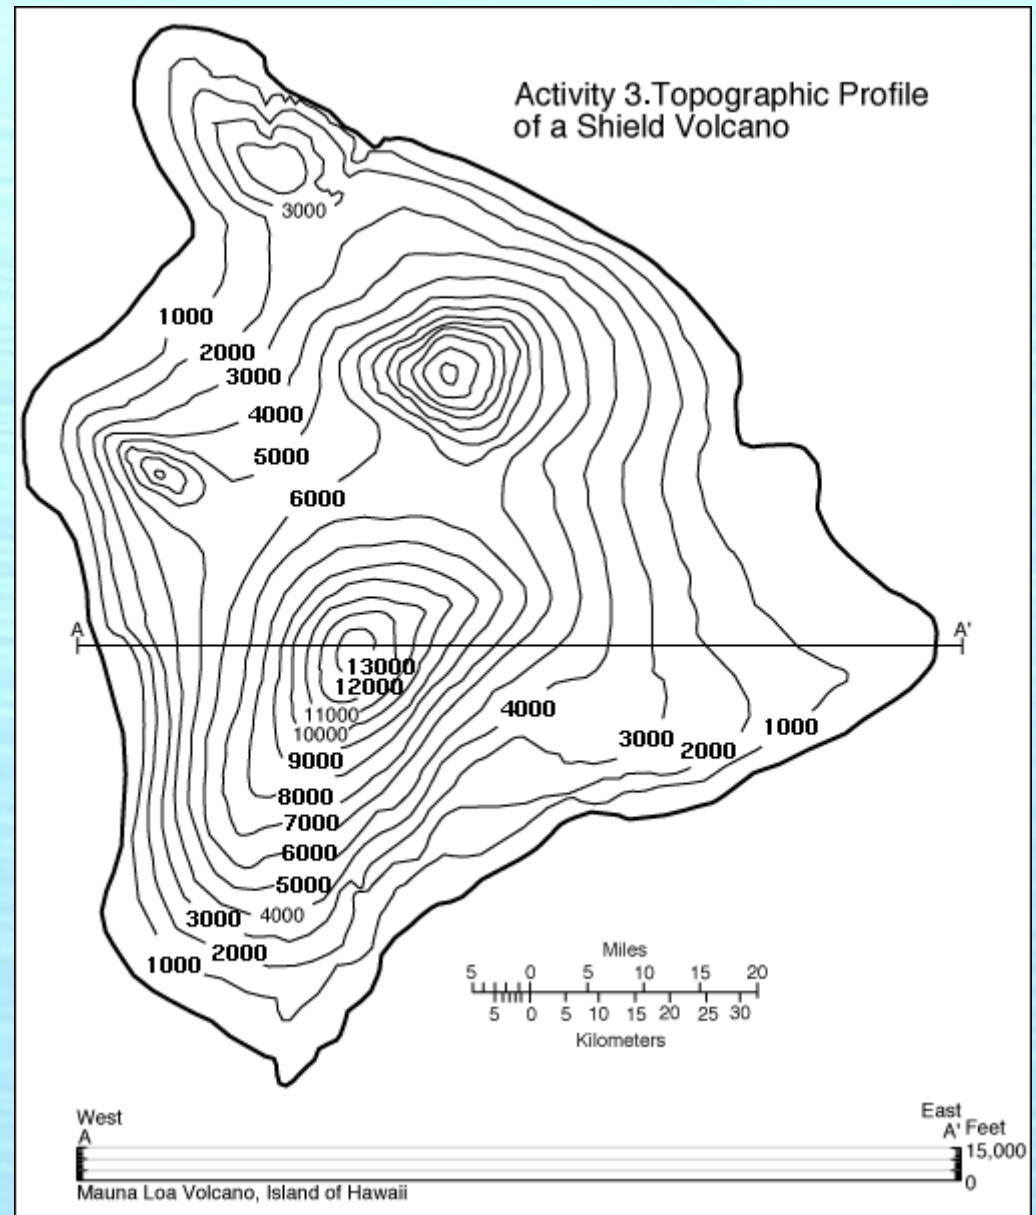

An electric field does 12 J of work on a charge of 0.0001 C as it moves from point A to point B. What is the voltage change between point A and point B?

How much work does this same field do on a charge of 0.0002 Coulombs?

Equipotentials

Lines of constant potential

Like contour lines on a map.

Equipotentials

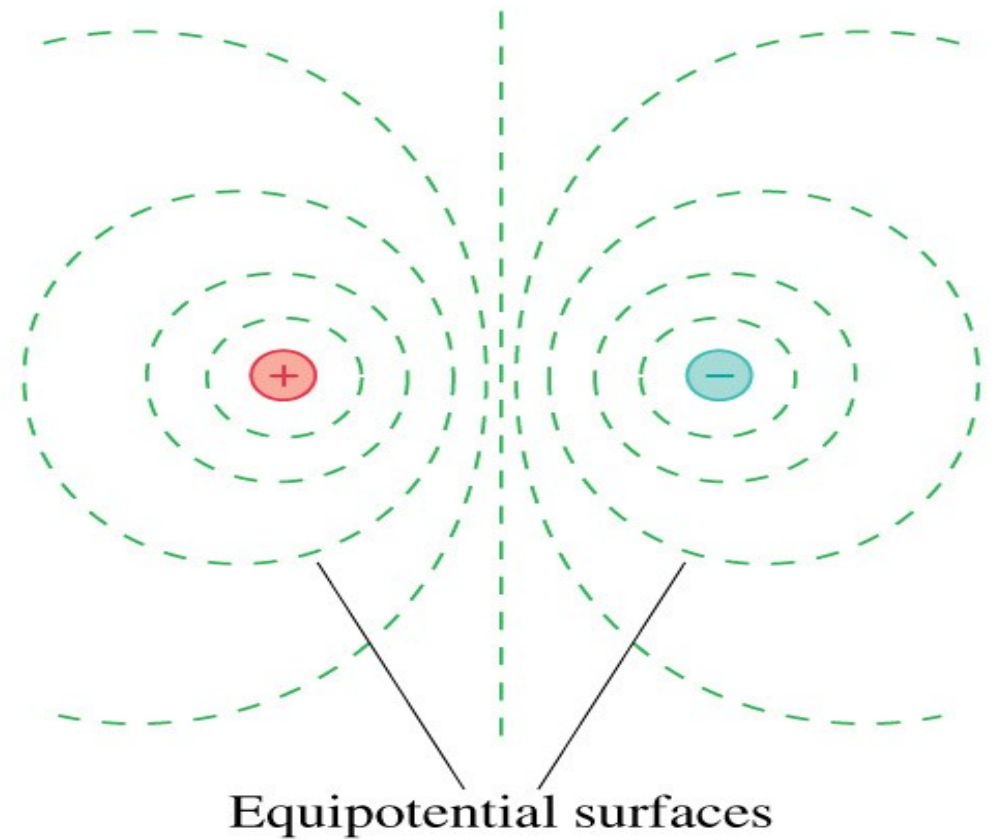

(b) Elevation graph

Bottom line

So if you put 1 Coulomb through 10 Volts, it acquires 10 J ... regardless of how there got to be 10 Volts there.

(a) Contour map

Equipotential surfaces

A battery can be a source of potential energy ... it's a charge escalator

A battery can be a source of potential energy ... it's a charge escalator ... like a Van de Graaff.

The charge “falls downhill” through the wire, but it can be sustained because of the charge escalator.

The charge escalator “lifts” charge from the negative side to the positive side. Charge q gains energy $\Delta U = q\Delta V_{\text{bat}}$.

Batteries

(Homework 9-7)

If a battery says 9-Volts, how much Work does it do on 3 Coulombs that pass through it?

Old televisions had “high voltage supplies” inside ... like a large voltage battery.

(Homework 9-8)

20

An electron is released from rest at the positive terminal of a 20,000 Volt battery, and the negative terminal is attached to the back of the TV screen. How fast does the electron hit the screen?
